

Exam Questions CISM

Certified Information Security Manager

<https://www.2passeasy.com/dumps/CISM/>

NEW QUESTION 1

The FIRST step in establishing a security governance program is to:

- A. conduct a risk assessment
- B. conduct a workshop for all end user
- C. prepare a security budget
- D. obtain high-level sponsorship

Answer: D

Explanation:

The establishment of a security governance program is possible only with the support and sponsorship of top management since security governance projects are enterprise wide and integrated into business processes. Conducting a risk assessment, conducting a workshop for all end users and preparing a security budget all follow once high-level sponsorship is obtained.

NEW QUESTION 2

Which of the following is MOST important to understand when developing a meaningful information security strategy?

- A. Regulatory environment
- B. International security standards
- C. Organizational risks
- D. Organizational goals

Answer: D

Explanation:

Alignment of security with business objectives requires an understanding of what an organization is trying to accomplish. The other choices are all elements that must be considered, but their importance is secondary and will vary depending on organizational goals.

NEW QUESTION 3

It is MOST important that information security architecture be aligned with which of the following?

- A. Industry best practices
- B. Information technology plans
- C. Information security best practices
- D. Business objectives and goals

Answer: D

Explanation:

Information security architecture should always be properly aligned with business goals and objectives. Alignment with IT plans or industry and security best practices is secondary by comparison.

NEW QUESTION 4

Successful implementation of information security governance will FIRST require:

- A. security awareness training
- B. updated security policies
- C. a computer incident management team
- D. a security architecture

Answer: B

Explanation:

Updated security policies are required to align management objectives with security procedures; management objectives translate into policy, policy translates into procedures. Security procedures will necessitate specialized teams such as the computer incident response and management group as well as specialized tools such as the security mechanisms that comprise the security architecture. Security awareness will promote the policies, procedures and appropriate use of the security mechanisms.

NEW QUESTION 5

Which of the following is the BEST method or technique to ensure the effective implementation of an information security program?

- A. Obtain the support of the board of directors
- B. Improve the content of the information security awareness program
- C. Improve the employees' knowledge of security policies
- D. Implement logical access controls to the information system

Answer: A

Explanation:

It is extremely difficult to implement an information security program without the aid and support of the board of directors. If they do not understand the importance

of security to the achievement of the business objectives, other measures will not be sufficient. Options B and (' are measures proposed to ensure the efficiency of the information security program implementation, but are of less significance than obtaining the aid and support of the board of directors. Option D is a measure to secure the enterprise information, but by itself is not a measure to ensure the broader effectiveness of an information security program.

NEW QUESTION 6

Investments in information security technologies should be based on:

- A. vulnerability assessment
- B. value analysis
- C. business climat
- D. audit recommendation

Answer: B

Explanation:

Investments in security technologies should be based on a value analysis and a sound business case. Demonstrated value takes precedence over the current business climate because it is ever changing. Basing decisions on audit recommendations would be reactive in nature and might not address the key business needs comprehensively. Vulnerability assessments are useful, but they do not determine whether the cost is justified.

NEW QUESTION 7

Which of the following MOST commonly falls within the scope of an information security governance steering committee?

- A. Interviewing candidates for information security specialist positions
- B. Developing content for security awareness programs
- C. Prioritizing information security initiatives
- D. Approving access to critical financial systems

Answer: C

Explanation:

Prioritizing information security initiatives is the only appropriate item. The interviewing of specialists should be performed by the information security manager, while the developing of program content should be performed by the information security staff. Approving access to critical financial systems is the responsibility of individual system data owners.

NEW QUESTION 8

An organization's information security strategy should be based on:

- A. managing risk relative to business objective
- B. managing risk to a zero level and minimizing insurance premium
- C. avoiding occurrence of risks so that insurance is not require
- D. transferring most risks to insurers and saving on control cost

Answer: A

Explanation:

Organizations must manage risks to a level that is acceptable for their business model, goals and objectives. A zero-level approach may be costly and not provide the effective benefit of additional revenue to the organization. Long-term maintenance of this approach may not be cost effective. Risks vary as business models, geography, and regulatory- and operational processes change. Insurance covers only a small portion of risks and requires that the organization have certain operational controls in place.

NEW QUESTION 9

An IS manager has decided to implement a security system to monitor access to the Internet and prevent access to numerous sites. Immediately upon installation, employees Hood the IT helpdesk with complaints of being unable to perform business functions on Internet sites. This is an example of:

- A. conflicting security controls with organizational need
- B. strong protection of information resource
- C. implementing appropriate controls to reduce ris
- D. proving information security's protective abilitie

Answer: A

Explanation:

The needs of the organization were not taken into account, so there is a conflict. This example is not strong protection, it is poorly configured. Implementing appropriate controls to reduce risk is not an appropriate control as it is being used. This does not prove the ability to protect, but proves the ability to interfere with business.

NEW QUESTION 10

The PRIMARY objective of a security steering group is to:

- A. ensure information security covers all business function
- B. ensure information security aligns with business goal
- C. raise information security awareness across the organizatio
- D. implement all decisions on security management across the organizatio

Answer: B

Explanation:

The security steering group comprises senior management of key business functions and has the primary objective to align the security strategy with the business direction. Option A is incorrect because all business areas may not be required to be covered by information security; but, if they do, the main purpose of the steering committee would be alignment more so than coverage. While raising awareness is important, this goal would not be carried out by the committee itself. The steering committee may delegate part of the decision making to the information security manager; however, if it retains this authority, it is not the primary goal.

NEW QUESTION 10

Information security governance is PRIMARILY driven by:

- A. technology constraint
- B. regulatory requirement
- C. litigation potential
- D. business strategy

Answer: D

Explanation:

Governance is directly tied to the strategy and direction of the business. Technology constraints, regulatory requirements and litigation potential are all important factors, but they are necessarily in line with the business strategy.

NEW QUESTION 14

A new regulation for safeguarding information processed by a specific type of transaction has come to the attention of an information security officer. The officer should FIRST:

- A. meet with stakeholders to decide how to comply
- B. analyze key risks in the compliance process
- C. assess whether existing controls meet the regulation
- D. update the existing security/privacy policy

Answer: C

Explanation:

If the organization is in compliance through existing controls, the need to perform other work related to the regulation is not a priority. The other choices are appropriate and important; however, they are actions that are subsequent and will depend on whether there is an existing control gap.

NEW QUESTION 19

When an information security manager is developing a strategic plan for information security, the timeline for the plan should be:

- A. aligned with the IT strategic plan
- B. based on the current rate of technological change
- C. three-to-five years for both hardware and software
- D. aligned with the business strategy

Answer: D

Explanation:

Any planning for information security should be properly aligned with the needs of the business. Technology should not come before the needs of the business, nor should planning be done on an artificial timetable that ignores business needs.

NEW QUESTION 23

Who should be responsible for enforcing access rights to application data?

- A. Data owners
- B. Business process owners
- C. The security steering committee
- D. Security administrators

Answer: D

Explanation:

As custodians, security administrators are responsible for enforcing access rights to data. Data owners are responsible for approving these access rights. Business process owners are sometimes the data owners as well, and would not be responsible for enforcement. The security steering committee would not be responsible for enforcement.

NEW QUESTION 26

Information security policy enforcement is the responsibility of the:

- A. security steering committee
- B. chief information officer (CIO).

- C. chief information security officer (CISO).
- D. chief compliance officer (CCO).

Answer: C

Explanation:

Information security policy enforcement is the responsibility of the chief information security officer (CISO), first and foremost. The board of directors and executive management should ensure that a security policy is in line with corporate objectives. The chief information officer (CIO) and the chief compliance officer (CCO) are involved in the enforcement of the policy but are not directly responsible for it.

NEW QUESTION 30

The FIRST step in developing an information security management program is to:

- A. identify business risks that affect the organizatio
- B. clarify organizational purpose for creating the progra
- C. assign responsibility for the progra
- D. assess adequacy of controls to mitigate business risk

Answer: B

Explanation:

In developing an information security management program, the first step is to clarify the organization's purpose for creating the program. This is a business decision based more on judgment than on any specific quantitative measures. After clarifying the purpose, the other choices are assigned and acted upon.

NEW QUESTION 32

Which of the following factors is a PRIMARY driver for information security governance that does not require any further justification?

- A. Alignment with industry best practices
- B. Business continuity investment
- C. Business benefits
- D. Regulatory compliance

Answer: D

Explanation:

Regulatory compliance can be a standalone driver for an information security governance measure. No further analysis nor justification is required since the entity has no choice in the regulatory requirements. Buy-in from business managers must be obtained by the information security manager when an information security governance measure is sought based on its alignment with industry best practices. Business continuity investment needs to be justified by business impact analysis. When an information security governance measure is sought based on qualitative business benefits, further analysis is required to determine whether the benefits outweigh the cost of the information security governance measure in question.

NEW QUESTION 36

Which of the following is an advantage of a centralized information security organizational structure?

- A. It is easier to promote security awareness
- B. It is easier to manage and contro
- C. It is more responsive to business unit need
- D. It provides a faster turnaround for security request

Answer: B

Explanation:

It is easier to manage and control a centralized structure. Promoting security awareness is an advantage of decentralization. Decentralization allows you to use field security personnel as security missionaries or ambassadors to spread the security awareness message. Decentralized operations allow security administrators to be more responsive. Being close to the business allows decentralized security administrators to achieve a faster turnaround than that achieved in a centralized operation.

NEW QUESTION 37

The MOST complete business case for security solutions is one that.

- A. includes appropriate justificatio
- B. explains the current risk profil
- C. details regulatory requirement
- D. identifies incidents and losse

Answer: A

Explanation:

Management is primarily interested in security solutions that can address risks in the most cost-effective way. To address the needs of an organization, a business case should address appropriate security solutions in line with the organizational strategy.

NEW QUESTION 42

Investment in security technology and processes should be based on:

- A. clear alignment with the goals and objectives of the organization
- B. success cases that have been experienced in previous projects
- C. best business practice
- D. safeguards that are inherent in existing technology

Answer: A

Explanation:

Organization maturity level for the protection of information is a clear alignment with goals and objectives of the organization. Experience in previous projects is dependent upon other business models which may not be applicable to the current model. Best business practices may not be applicable to the organization's business needs. Safeguards inherent to existing technology are low cost but may not address all business needs and/or goals of the organization.

NEW QUESTION 44

Which of the following would help to change an organization's security culture?

- A. Develop procedures to enforce the information security policy
- B. Obtain strong management support
- C. Implement strict technical security controls
- D. Periodically audit compliance with the information security policy

Answer: B

Explanation:

Management support and pressure will help to change an organization's culture. Procedures will support an information security policy, but cannot change the culture of the organization. Technical controls will provide more security to an information system and staff; however, this does not mean the culture will be changed. Auditing will help to ensure the effectiveness of the information security policy; however, auditing is not effective in changing the culture of the company.

NEW QUESTION 47

Which of the following is a benefit of information security governance?

- A. Reduction of the potential for civil or legal liability
- B. Questioning trust in vendor relationships
- C. Increasing the risk of decisions based on incomplete management information
- D. Direct involvement of senior management in developing control processes

Answer: A

Explanation:

Information security governance decreases the risk of civil or legal liability. The remaining answers are incorrect. Option D appears to be correct, but senior management would provide oversight and approval as opposed to direct involvement in developing control processes.

NEW QUESTION 48

Which of the following is the MOST important information to include in an information security standard?

- A. Creation date
- B. Author name
- C. Initial draft approval date
- D. Last review date

Answer: D

Explanation:

The last review date confirms the currency of the standard, affirming that management has reviewed the standard to assure that nothing in the environment has changed that would necessitate an update to the standard. The name of the author as well as the creation and draft dates are not that important.

NEW QUESTION 53

An information security manager mapping a job description to types of data access is MOST likely to adhere to which of the following information security principles?

- A. Ethics
- B. Proportionality
- C. Integration
- D. Accountability

Answer: B

Explanation:

Information security controls should be proportionate to the risks of modification, denial of use or disclosure of the information. It is advisable to learn if the job description is apportioning more data than are necessary for that position to execute the business rules (types of data access). Principles of ethics and integration have the least to do with mapping job description to types of data access. The principle of accountability would be the second most adhered to principle since people with access to data may not always be accountable but may be required to perform an operation.

NEW QUESTION 55

What will have the HIGHEST impact on standard information security governance models?

- A. Number of employees
- B. Distance between physical locations
- C. Complexity of organizational structure
- D. Organizational budget

Answer: C

Explanation:

Information security governance models are highly dependent on the overall organizational structure. Some of the elements that impact organizational structure are multiple missions and functions across the organization, leadership and lines of communication. Number of employees and distance between physical locations have less impact on information security governance models since well-defined process, technology and people components intermingle to provide the proper governance. Organizational budget is not a major impact once good governance models are in place, hence governance will help in effective management of the organization's budget.

NEW QUESTION 59

What is the PRIMARY role of the information security manager in the process of information classification within an organization?

- A. Defining and ratifying the classification structure of information assets
- B. Deciding the classification levels applied to the organization's information assets
- C. Securing information assets in accordance with their classification
- D. Checking if information assets have been classified properly

Answer: A

Explanation:

Defining and ratifying the classification structure of information assets is the primary role of the information security manager in the process of information classification within the organization. Choice B is incorrect because the final responsibility for deciding the classification levels rests with the data owners. Choice C is incorrect because the job of securing information assets is the responsibility of the data custodians. Choice D may be a role of an information security manager but is not the key role in this context.

NEW QUESTION 61

A risk assessment and business impact analysis (BIA) have been completed for a major proposed purchase and new process for an organization. There is disagreement between the information security manager and the business department manager who will own the process regarding the results and the assigned risk. Which of the following would be the BEST approach of the information security manager?

- A. Acceptance of the business manager's decision on the risk to the corporation
- B. Acceptance of the information security manager's decision on the risk to the corporation
- C. Review of the assessment with executive management for final input
- D. A new risk assessment and BIA are needed to resolve the disagreement

Answer: C

Explanation:

Executive management must be supportive of the process and fully understand and agree with the results since risk management decisions can often have a large financial impact and require major changes. Risk management means different things to different people, depending upon their role in the organization, so the input of executive management is important to the process.

NEW QUESTION 62

Effective IT governance is BEST ensured by:

- A. utilizing a bottom-up approach
- B. management by the IT department
- C. referring the matter to the organization's legal department
- D. utilizing a top-down approach

Answer: D

Explanation:

Effective IT governance needs to be a top-down initiative, with the board and executive management setting clear policies, goals and objectives and providing for ongoing monitoring of the same. Focus on the regulatory issues and management priorities may not be reflected effectively by a bottom-up approach. IT governance affects the entire organization and is not a matter concerning only the management of IT. The legal department is part of the overall governance process, but cannot take full responsibility.

NEW QUESTION 67

The PRIMARY concern of an information security manager documenting a formal data retention policy would be:

- A. generally accepted industry best practice
- B. business requirement
- C. legislative and regulatory requirement
- D. storage availability

Answer: B

Explanation:

The primary concern will be to comply with legislation and regulation but only if this is a genuine business requirement. Best practices may be a useful guide but not a primary concern. Legislative and regulatory requirements are only relevant if compliance is a business need. Storage is irrelevant since whatever is needed must be provided

NEW QUESTION 71

The MOST basic requirement for an information security governance program is to:

- A. be aligned with the corporate business strateg
- B. be based on a sound risk management approac
- C. provide adequate regulatory complianc
- D. provide best practices for security- initiative

Answer: A

Explanation:

To receive senior management support, an information security program should be aligned with the corporate business strategy. Risk management is a requirement of an information security program which should take into consideration the business strategy. Security governance is much broader than just regulatory compliance. Best practice is an operational concern and does not have a direct impact on a governance program.

NEW QUESTION 73

How would an information security manager balance the potentially conflicting requirements of an international organization's security standards and local regulation?

- A. Give organization standards preference over local regulations
- B. Follow local regulations only
- C. Make the organization aware of those standards where local regulations causes conflicts
- D. Negotiate a local version of the organization standards

Answer: D

Explanation:

Adherence to local regulations must always be the priority. Not following local regulations can prove detrimental to the group organization. Following local regulations only is incorrect since there needs to be some recognition of organization requirements. Making an organization aware of standards is a sensible step, but is not a total solution. Negotiating a local version of the organization standards is the most effective compromise in this situation.

NEW QUESTION 75

Which of the following would BEST prepare an information security manager for regulatory reviews?

- A. Assign an information security administrator as regulatory liaison
- B. Perform self-assessments using regulatory guidelines and reports
- C. Assess previous regulatory reports with process owners input
- D. Ensure all regulatory inquiries are sanctioned by the legal department

Answer: B

Explanation:

Self-assessments provide the best feedback on readiness and permit identification of items requiring remediation. Directing regulators to a specific person or department, or assessing previous reports, is not as effective. The legal department should review all formal inquiries but this does not help prepare for a regulatory review.

NEW QUESTION 77

To justify the need to invest in a forensic analysis tool, an information security manager should FIRST:

- A. review the functionalities and implementation requirements of the solutio
- B. review comparison reports of tool implementation in peer companie
- C. provide examples of situations where such a tool would be usefu
- D. substantiate the investment in meeting organizational need

Answer: D

Explanation:

Any investment must be reviewed to determine whether it is cost effective and supports the organizational strategy. It is important to review the features and functionalities provided by such a tool, and to provide examples of situations where the tool would be useful, but that comes after substantiating the investment and return on investment to the organization.

NEW QUESTION 78

The organization has decided to outsource the majority of the IT department with a vendor that is hosting servers in a foreign country. Of the following, which is the MOST critical security consideration?

- A. Laws and regulations of the country of origin may not be enforceable in the foreign country
- B. A security breach notification might get delayed due to the time difference
- C. Additional network intrusion detection sensors should be installed, resulting in an additional cost
- D. The company could lose physical control over the server and be unable to monitor the physical security posture of the server

Answer: A

Explanation:

A company is held to the local laws and regulations of the country in which the company resides, even if the company decides to place servers with a vendor that hosts the servers in a foreign country. A potential violation of local laws applicable to the company might not be recognized or rectified (i.e., prosecuted) due to the lack of knowledge of the local laws that are applicable and the inability to enforce the laws. Option B is not a problem. Time difference does not play a role in a 24/7 environment. Pagers, cellular phones, telephones, etc. are usually available to communicate notifications. Option C is a manageable problem that requires additional funding, but can be addressed. Option D is a problem that can be addressed. Most hosting providers have standardized the level of physical security that is in place. Regular physical audits or a SAS 70 report can address such concerns.

NEW QUESTION 79

A security manager is preparing a report to obtain the commitment of executive management to a security program. Inclusion of which of the following would be of MOST value?

- A. Examples of genuine incidents at similar organizations
- B. Statement of generally accepted best practices
- C. Associating realistic threats to corporate objectives
- D. Analysis of current technological exposures

Answer: C

Explanation:

Linking realistic threats to key business objectives will direct executive attention to them. All other options are supportive but not of as great a value as choice C when trying to obtain the funds for a new program.

NEW QUESTION 81

Data owners must provide a safe and secure environment to ensure confidentiality, integrity and availability of the transaction. This is an example of an information security:

- A. baseline
- B. strategy
- C. procedure
- D. policy

Answer: D

Explanation:

A policy is a high-level statement of an organization's beliefs, goals, roles and objectives. Baselines assume a minimum security level throughout an organization. The information security strategy aligns the information security program with business objectives rather than making control statements. A procedure is a step-by-step process of how policy and standards will be implemented.

NEW QUESTION 84

When identifying legal and regulatory issues affecting information security, which of the following would represent the BEST approach to developing information security policies?

- A. Create separate policies to address each regulation
- B. Develop policies that meet all mandated requirements
- C. Incorporate policy statements provided by regulators
- D. Develop a compliance risk assessment

Answer: B

Explanation:

It will be much more efficient to craft all relevant requirements into policies than to create separate versions. Using statements provided by regulators will not capture all of the requirements mandated by different regulators. A compliance risk assessment is an important tool to verify that procedures ensure compliance once the policies have been established.

NEW QUESTION 89

Which of the following is the MOST essential task for a chief information security officer (CISO) to perform?

- A. Update platform-level security settings
- B. Conduct disaster recovery test exercises
- C. Approve access to critical financial systems
- D. Develop an information security strategy paper

Answer: D

Explanation:

Developing a strategy paper on information security would be the most appropriate. Approving access would be the job of the data owner. Updating platform-level security and conducting recovery test exercises would be less essential since these are administrative tasks.

NEW QUESTION 91

Who is ultimately responsible for the organization's information?

- A. Data custodian
- B. Chief information security officer (CISO)
- C. Board of directors
- D. Chief information officer (CIO)

Answer: C

Explanation:

The board of directors is ultimately responsible for the organization's information and is tasked with responding to issues that affect its protection. The data custodian is responsible for the maintenance and protection of data. This role is usually filled by the IT department. The chief information security officer (CISO) is responsible for security and carrying out senior management's directives. The chief information officer (CIO) is responsible for information technology within the organization and is not ultimately responsible for the organization's information.

NEW QUESTION 95

In order to highlight to management the importance of network security, the security manager should FIRST:

- A. develop a security architectur
- B. install a network intrusion detection system (NIDS) and prepare a list of attack
- C. develop a network security polic
- D. conduct a risk assessmen

Answer: D

Explanation:

A risk assessment would be most helpful to management in understanding at a very high level the threats, probabilities and existing controls. Developing a security architecture, installing a network intrusion detection system (NIDS) and preparing a list of attacks on the network and developing a network security policy would not be as effective in highlighting the importance to management and would follow only after performing a risk assessment.

NEW QUESTION 96

A good privacy statement should include:

- A. notification of liability on accuracy of informatio
- B. notification that information will be encrypte
- C. what the company will do with information it collect
- D. a description of the information classification proces

Answer: C

Explanation:

Most privacy laws and regulations require disclosure on how information will be used. Choice A is incorrect because that information should be located in the web site's disclaimer. Choice B is incorrect because, although encryption may be applied, this is not generally disclosed. Choice D is incorrect because information classification would be contained in a separate policy.

NEW QUESTION 98

Retention of business records should PRIMARILY be based on:

- A. business strategy and directio
- B. regulatory and legal requirement
- C. storage capacity and longevit
- D. business ease and value analysi

Answer: B

Explanation:

Retention of business records is generally driven by legal and regulatory requirements. Business strategy and direction would not normally apply nor would they override legal and regulatory requirements. Storage capacity and longevity are important but secondary issues. Business case and value analysis would be secondary to complying with legal and regulatory requirements.

NEW QUESTION 103

To achieve effective strategic alignment of security initiatives, it is important that:

- A. Steering committee leadership be selected by rotatio
- B. Inputs be obtained and consensus achieved between the major organizational unit
- C. The business strategy be updated periodical
- D. Procedures and standards be approved by all departmental head

Answer: B

Explanation:

It is important to achieve consensus on risks and controls, and obtain inputs from various organizational entities since security needs to be aligned to the needs of the organization. Rotation of steering committee leadership does not help in achieving strategic alignment. Updating business strategy does not lead to strategic alignment of security initiatives. Procedures and standards need not be approved by all departmental heads

NEW QUESTION 105

When implementing effective security governance within the requirements of the company's security strategy, which of the following is the MOST important factor to consider?

- A. Preserving the confidentiality of sensitive data
- B. Establishing international security standards for data sharing
- C. Adhering to corporate privacy standards
- D. Establishing system manager responsibility for information security

Answer: A

Explanation:

The goal of information security is to protect the organization's information assets. International security standards are situational, depending upon the company and its business. Adhering to corporate privacy standards is important, but those standards must be appropriate and adequate and are not the most important factor to consider. All employees are responsible for information security, but it is not the most important factor to consider.

NEW QUESTION 109

The MOST important factor in planning for the long-term retention of electronically stored business records is to take into account potential changes in:

- A. storage capacity and shelf life
- B. regulatory and legal requirement
- C. business strategy and direction
- D. application systems and media

Answer: D

Explanation:

Long-term retention of business records may be severely impacted by changes in application systems and media. For example, data stored in nonstandard formats that can only be read and interpreted by previously decommissioned applications may be difficult, if not impossible, to recover. Business strategy and direction do not generally apply, nor do legal and regulatory requirements. Storage capacity and shelf life are important but secondary issues.

NEW QUESTION 110

Which of the following is the BEST justification to convince management to invest in an information security program?

- A. Cost reduction
- B. Compliance with company policies
- C. Protection of business assets
- D. Increased business value

Answer: D

Explanation:

Investing in an information security program should increase business value and confidence. Cost reduction by itself is rarely the motivator for implementing an information security program. Compliance is secondary to business value. Increasing business value may include protection of business assets.

NEW QUESTION 112

When designing an information security quarterly report to management, the MOST important element to be considered should be the:

- A. information security metric
- B. knowledge required to analyze each issue
- C. linkage to business area objective
- D. baseline against which metrics are evaluated

Answer: C

Explanation:

The link to business objectives is the most important element that would be considered by management. Information security metrics should be put in the context of impact to management objectives. Although important, the security knowledge required would not be the first element to be considered. Baseline against the information security metrics will be considered later in the process.

NEW QUESTION 114

Which of the following represents the MAJOR focus of privacy regulations?

- A. Unrestricted data mining
- B. Identity theft
- C. Human rights protection
- D. Identifiable personal data

Answer: D

Explanation:

Protection of identifiable personal data is the major focus of recent privacy regulations such as the Health Insurance Portability and Accountability Act (HIPAA). Data mining is an accepted tool for ad hoc reporting; it could pose a threat to privacy only if it violates regulator's provisions. Identity theft is a potential consequence of privacy violations but not the main focus of many regulations. Human rights addresses privacy issues but is not the main focus of regulations.

NEW QUESTION 118

Developing a successful business case for the acquisition of information security software products can BEST be assisted by:

- A. assessing the frequency of incident
- B. quantifying the cost of control failure
- C. calculating return on investment (ROD) projection
- D. comparing spending against similar organization

Answer: C

Explanation:

Calculating the return on investment (ROD) will most closely align security with the impact on the bottom line. Frequency and cost of incidents are factors that go into determining the impact on the business but, by themselves, are insufficient. Comparing spending against similar organizations can be problematic since similar organizations may have different business goals and appetites for risk.

NEW QUESTION 121

Information security should be:

- A. focused on eliminating all risk
- B. a balance between technical and business requirement
- C. driven by regulatory requirement
- D. defined by the board of director

Answer: B

Explanation:

Information security should ensure that business objectives are met given available technical capabilities, resource constraints and compliance requirements. It is not practical or feasible to eliminate all risks. Regulatory requirements must be considered, but are inputs to the business considerations. The board of directors does not define information security, but provides direction in support of the business goals and objectives.

NEW QUESTION 123

Temporarily deactivating some monitoring processes, even if supported by an acceptance of operational risk, may not be acceptable to the information security manager if:

- A. it implies compliance risk
- B. short-term impact cannot be determine
- C. it violates industry security practice
- D. changes in the roles matrix cannot be detecte

Answer: A

Explanation:

Monitoring processes are also required to guarantee fulfillment of laws and regulations of the organization and, therefore, the information security manager will be obligated to comply with the law. Choices B and C are evaluated as part of the operational risk. Choice D is unlikely to be as critical a breach of regulatory legislation. The acceptance of operational risks overrides choices B, C and D.

NEW QUESTION 128

Which of the following requirements would have the lowest level of priority in information security?

- A. Technical
- B. Regulatory
- C. Privacy
- D. Business

Answer: A

Explanation:

Information security priorities may, at times, override technical specifications, which then must be rewritten to conform to minimum security standards. Regulatory and privacy requirements are government-mandated and, therefore, not subject to override. The needs of the business should always take precedence in deciding information security priorities.

NEW QUESTION 129

Which of the following would be MOST helpful to achieve alignment between information security and organization objectives?

- A. Key control monitoring

- B. A robust security awareness program
- C. A security program that enables business activities
- D. An effective security architecture

Answer: C

Explanation:

A security program enabling business activities would be most helpful to achieve alignment between information security and organization objectives. All of the other choices are part of the security program and would not individually and directly help as much as the security program.

NEW QUESTION 133

Which of the following is MOST appropriate for inclusion in an information security strategy?

- A. Business controls designated as key controls
- B. Security processes, methods, tools and techniques
- C. Firewall rule sets, network defaults and intrusion detection system (IDS) settings
- D. Budget estimates to acquire specific security tools

Answer: B

Explanation:

A set of security objectives, processes, methods, tools and techniques together constitute a security strategy. Although IT and business governance are intertwined, business controls may not be included in a security strategy. Budgets will generally not be included in an information security strategy. Additionally, until information security strategy is formulated and implemented, specific tools will not be identified and specific cost estimates will not be available. Firewall rule sets, network defaults and intrusion detection system (IDS) settings are technical details subject to periodic change, and are not appropriate content for a strategy document.

NEW QUESTION 137

Which of the following would be the MOST important goal of an information security governance program?

- A. Review of internal control mechanisms
- B. Effective involvement in business decision making
- C. Total elimination of risk factors
- D. Ensuring trust in data

Answer: D

Explanation:

The development of trust in the integrity of information among stakeholders should be the primary goal of information security governance. Review of internal control mechanisms relates more to auditing, while the total elimination of risk factors is not practical or possible. Proactive involvement in business decision making implies that security needs dictate business needs when, in fact, just the opposite is true. Involvement in decision making is important only to ensure business data integrity so that data can be trusted.

NEW QUESTION 141

Who in an organization has the responsibility for classifying information?

- A. Data custodian
- B. Database administrator
- C. Information security officer
- D. Data owner

Answer: D

Explanation:

The data owner has full responsibility over data. The data custodian is responsible for securing the information. The database administrator carries out the technical administration. The information security officer oversees the overall classification management of the information.

NEW QUESTION 142

Which of the following situations must be corrected FIRST to ensure successful information security governance within an organization?

- A. The information security department has difficulty filling vacancies
- B. The chief information officer (CIO) approves security policy change
- C. The information security oversight committee only meets quarterly
- D. The data center manager has final signoff on all security projects

Answer: D

Explanation:

A steering committee should be in place to approve all security projects. The fact that the data center manager has final signoff for all security projects indicates that a steering committee is not being used and that information security is relegated to a subordinate place in the organization. This would indicate a failure of information security governance. It is not inappropriate for an oversight or steering committee to meet quarterly. Similarly, it may be desirable to have the chief information officer (CIO) approve the security policy due to the size of the organization and frequency of updates. Difficulty in filling vacancies is not uncommon

due to the shortage of good, qualified information security professionals.

NEW QUESTION 147

Who should drive the risk analysis for an organization?

- A. Senior management
- B. Security manager
- C. Quality manager
- D. Legal department

Answer: B

Explanation:

Although senior management should support and sponsor a risk analysis, the know-how and the management of the project will be with the security department. Quality management and the legal department will contribute to the project.

NEW QUESTION 152

The MOST important factor in ensuring the success of an information security program is effective:

- A. communication of information security requirements to all users in the organization
- B. formulation of policies and procedures for information security
- C. alignment with organizational goals and objectives
- D. monitoring compliance with information security policies and procedure

Answer: C

Explanation:

The success of security programs is dependent upon alignment with organizational goals and objectives. Communication is a secondary step. Effective communication and education of users is a critical determinant of success but alignment with organizational goals and objectives is the most important factor for success. Mere formulation of policies without effective communication to users will not ensure success. Monitoring compliance with information security policies and procedures can be, at best, a detective mechanism that will not lead to success in the midst of uninformed users.

NEW QUESTION 156

An organization's information security processes are currently defined as ad hoc. In seeking to improve their performance level, the next step for the organization should be to:

- A. ensure that security processes are consistent across the organization
- B. enforce baseline security levels across the organization
- C. ensure that security processes are fully documented
- D. implement monitoring of key performance indicators for security processes

Answer: A

Explanation:

The organization first needs to move from ad hoc to repeatable processes. The organization then needs to document the processes and implement process monitoring and measurement. Baseline security levels will not necessarily assist in process improvement since baselining focuses primarily on control improvement. The organization needs to standardize processes both before documentation, and before monitoring and measurement.

NEW QUESTION 159

When performing a quantitative risk analysis, which of the following is MOST important to estimate the potential loss?

- A. Evaluate productivity losses
- B. Assess the impact of confidential data disclosure
- C. Calculate the value of the information or asset
- D. Measure the probability of occurrence of each threat

Answer: C

Explanation:

Calculating the value of the information or asset is the first step in a risk analysis process to determine the impact to the organization, which is the ultimate goal. Determining how much productivity could be lost and how much it would cost is a step in the estimation of potential risk process. Knowing the impact if confidential information is disclosed is also a step in the estimation of potential risk. Measuring the probability of occurrence for each threat identified is a step in performing a threat analysis and therefore a partial answer.

NEW QUESTION 160

Which of the following would be MOST useful in developing a series of recovery time objectives (RTOs)?

- A. Gap analysis
- B. Regression analysis
- C. Risk analysis
- D. Business impact analysis

Answer: D

Explanation:

Recovery time objectives (RTOs) are a primary deliverable of a business impact analysis. RTOs relate to the financial impact of a system not being available. A gap analysis is useful in addressing the differences between the current state and an ideal future state. Regression analysis is used to test changes to program modules. Risk analysis is a component of the business impact analysis.

NEW QUESTION 161

One way to determine control effectiveness is by determining:

- A. whether it is preventive, detective or compensator
- B. the capability of providing notification of failure
- C. the test results of intended objective
- D. the evaluation and analysis of reliability

Answer: C

Explanation:

Control effectiveness requires a process to verify that the control process worked as intended. Examples such as dual-control or dual-entry bookkeeping provide verification and assurance that the process operated as intended. The type of control is not relevant, and notification of failure is not determinative of control strength. Reliability is not an indication of control strength; weak controls can be highly reliable, even if they are ineffective controls.

NEW QUESTION 165

Which of the following would a security manager establish to determine the target for restoration of normal processing?

- A. Recovery time objective (RTO)
- B. Maximum tolerable outage (MTO)
- C. Recovery point objectives (RPOs)
- D. Services delivery objectives (SDOs)

Answer: A

Explanation:

Recovery time objective (RTO) is the length of time from the moment of an interruption until the time the process must be functioning at a service level sufficient to limit financial and operational impacts to an acceptable level. Maximum tolerable outage (MTO) is the maximum time for which an organization can operate in a reduced mode. Recovery point objectives (RPOs) relate to the age of the data required for recovery. Services delivery objectives (SDOs) are the levels of service required in reduced mode.

NEW QUESTION 170

All risk management activities are PRIMARILY designed to reduce impacts to:

- A. a level defined by the security manager
- B. an acceptable level based on organizational risk tolerance
- C. a minimum level consistent with regulatory requirement
- D. the minimum level possible

Answer: B

Explanation:

The aim of risk management is to reduce impacts to an acceptable level. "Acceptable" or "reasonable" are relative terms that can vary based on environment and circumstances. A minimum level that is consistent with regulatory requirements may not be consistent with business objectives, and regulators typically do not assign risk levels. The minimum level possible may not be aligned with business requirements.

NEW QUESTION 173

The value of information assets is BEST determined by:

- A. individual business manager
- B. business systems analyst
- C. information security manager
- D. industry averages benchmarking

Answer: A

Explanation:

Individual business managers are in the best position to determine the value of information assets since they are most knowledgeable of the assets' impact on the business. Business systems developers and information security managers are not as knowledgeable regarding the impact on the business. Peer companies' industry averages do not necessarily provide detailed enough information nor are they as relevant to the unique aspects of the business.

NEW QUESTION 178

The BEST strategy for risk management is to:

- A. achieve a balance between risk and organizational goal
- B. reduce risk to an acceptable level

- C. ensure that policy development properly considers organizational risk
- D. ensure that all unmitigated risks are accepted by management

Answer: B

Explanation:

The best strategy for risk management is to reduce risk to an acceptable level, as this will take into account the organization's appetite for risk and the fact that it would not be practical to eliminate all risk. Achieving balance between risk and organizational goals is not always practical. Policy development must consider organizational risks as well as business objectives. It may be prudent to ensure that management understands and accepts risks that it is not willing to mitigate, but that is a practice and is not sufficient to be considered a strategy.

NEW QUESTION 180

Which of the following would be the MOST important factor to be considered in the loss of mobile equipment with unencrypted data?

- A. Disclosure of personal information
- B. Sufficient coverage of the insurance policy for accidental losses
- C. Intrinsic value of the data stored on the equipment
- D. Replacement cost of the equipment

Answer: C

Explanation:

When mobile equipment is lost or stolen, the information contained on the equipment matters most in determining the impact of the loss. The more sensitive the information, the greater the liability. If staff carries mobile equipment for business purposes, an organization must develop a clear policy as to what information should be kept on the equipment and for what purpose. Personal information is not defined in the question as the data that were lost. Insurance may be a relatively smaller issue as compared with information theft or opportunity loss, although insurance is also an important factor for a successful business. Cost of equipment would be a less important issue as compared with other choices.

NEW QUESTION 182

Attackers who exploit cross-site scripting vulnerabilities take advantage of:

- A. a lack of proper input validation control
- B. weak authentication controls in the web application layer
- C. flawed cryptographic secure sockets layer (SSL) implementations and short key length
- D. implicit web application trust relationship

Answer: A

Explanation:

Cross-site scripting attacks inject malformed input. Attackers who exploit weak application authentication controls can gain unauthorized access to applications and this has little to do with cross-site scripting vulnerabilities. Attackers who exploit flawed cryptographic secure sockets layer (SSL) implementations and short key lengths can sniff network traffic and crack keys to gain unauthorized access to information. This has little to do with cross-site scripting vulnerabilities. Web application trust relationships do not relate directly to the attack.

NEW QUESTION 184

The security responsibility of data custodians in an organization will include:

- A. assuming overall protection of information asset
- B. determining data classification level
- C. implementing security controls in products they install
- D. ensuring security measures are consistent with policy

Answer: D

Explanation:

Security responsibilities of data custodians within an organization include ensuring that appropriate security measures are maintained and are consistent with organizational policy. Executive management holds overall responsibility for protection of the information assets. Data owners determine data classification levels for information assets so that appropriate levels of controls can be provided to meet the requirements relating to confidentiality, integrity and availability. Implementation of information security in products is the responsibility of the IT developers.

NEW QUESTION 186

After assessing and mitigating the risks of a web application, who should decide on the acceptance of residual application risks?

- A. Information security officer
- B. Chief information officer (CIO)
- C. Business owner
- D. Chief executive officer (CEO)

Answer: C

Explanation:

The business owner of the application needs to understand and accept the residual application risks.

NEW QUESTION 187

During which phase of development is it MOST appropriate to begin assessing the risk of a new application system?

- A. Feasibility
- B. Design
- C. Development
- D. Testing

Answer: A

Explanation:

Risk should be addressed as early in the development of a new application system as possible. In some cases, identified risks could be mitigated through design changes. If needed changes are not identified until design has already commenced, such changes become more expensive. For this reason, beginning risk assessment during the design, development or testing phases is not the best solution.

NEW QUESTION 189

A risk management program would be expected to:

- A. remove all inherent risk
- B. maintain residual risk at an acceptable level
- C. implement preventive controls for every threat
- D. reduce control risk to zero

Answer: B

Explanation:

The object of risk management is to ensure that all residual risk is maintained at a level acceptable to the business; it is not intended to remove every identified risk or implement controls for every threat since this may not be cost-effective. Control risk, i.e., that a control may not be effective, is a component of the program but is unlikely to be reduced to zero.

NEW QUESTION 194

When the computer incident response team (CIRT) finds clear evidence that a hacker has penetrated the corporate network and modified customer information, an information security manager should FIRST notify:

- A. the information security steering committee
- B. customers who may be impacted
- C. data owners who may be impacted
- D. regulatory agencies overseeing privacy

Answer: C

Explanation:

The data owners should be notified first so they can take steps to determine the extent of the damage and coordinate a plan for corrective action with the computer incident response team. Other parties will be notified later as required by corporate policy and regulatory requirements.

NEW QUESTION 196

After obtaining commitment from senior management, which of the following should be completed NEXT when establishing an information security program?

- A. Define security metrics
- B. Conduct a risk assessment
- C. Perform a gap analysis
- D. Procure security tools

Answer: B

Explanation:

When establishing an information security program, conducting a risk assessment is key to identifying the needs of the organization and developing a security strategy. Defining security metrics, performing a gap analysis and procuring security tools are all subsequent considerations.

NEW QUESTION 197

Which of the following is the PRIMARY reason for implementing a risk management program?

- A. Allows the organization to eliminate risk
- B. Is a necessary part of management's due diligence
- C. Satisfies audit and regulatory requirements
- D. Assists in incrementing the return on investment (ROI)

Answer: B

Explanation:

The key reason for performing risk management is that it is part of management's due diligence. The elimination of all risk is not possible. Satisfying audit and regulatory requirements is of secondary importance. A risk management program may or may not increase the return on investment (ROI).

NEW QUESTION 202

An organization has a process in place that involves the use of a vendor. A risk assessment was completed during the development of the process. A year after the implementation a monetary decision has been made to use a different vendor. What, if anything, should occur?

- A. Nothing, since a risk assessment was completed during developmen
- B. A vulnerability assessment should be conducte
- C. A new risk assessment should be performe
- D. The new vendor's SAS 70 type II report should be reviewe

Answer: C

Explanation:

The risk assessment process is continual and any changes to an established process should include a new- risk assessment. While a review of the SAS 70 report and a vulnerability assessment may be components of a risk assessment, neither would constitute sufficient due diligence on its own.

NEW QUESTION 204

The MOST important function of a risk management program is to:

- A. quantify overall ris
- B. minimize residual ris
- C. eliminate inherent ris
- D. maximize the sum of all annualized loss expectancies (ALEs).

Answer: B

Explanation:

A risk management program should minimize the amount of risk that cannot be otherwise eliminated or transferred; this is the residual risk to the organization. Quantifying overall risk is important but not as critical as the end result. Eliminating inherent risk is virtually impossible. Maximizing the sum of all ALEs is actually the opposite of what is desirable.

NEW QUESTION 206

The recovery point objective (RPO) requires which of the following?

- A. Disaster declaration
- B. Before-image restoration
- C. System restoration
- D. After-image processing

Answer: B

Explanation:

The recovery point objective (RPO) is the point in the processing flow at which system recovery should occur. This is the predetermined state of the application processing and data used to restore the system and to continue the processing flow. Disaster declaration is independent of this processing checkpoint. Restoration of the system can occur at a later date, as does the return to normal, after-image processing.

NEW QUESTION 210

Risk assessment is MOST effective when performed:

- A. at the beginning of security program developmen
- B. on a continuous basi
- C. while developing the business case for the security progra
- D. during the business change proces

Answer: B

Explanation:

Risk assessment needs to be performed on a continuous basis because of organizational and technical changes. Risk assessment must take into account all significant changes in order to be effective.

NEW QUESTION 212

The MAIN reason why asset classification is important to a successful information security program is because classification determines:

- A. the priority and extent of risk mitigation effort
- B. the amount of insurance needed in case of los
- C. the appropriate level of protection to the asse
- D. how protection levels compare to peer organization

Answer: C

Explanation:

Protection should be proportional to the value of the asset. Classification is based upon the value of the asset to the organization. The amount of insurance needed in case of loss may not be applicable in each case. Peer organizations may have different classification schemes for their assets.

NEW QUESTION 214

Which of the following security activities should be implemented in the change management process to identify key vulnerabilities introduced by changes?

- A. Business impact analysis (BIA)
- B. Penetration testing
- C. Audit and review
- D. Threat analysis

Answer: B

Explanation:

Penetration testing focuses on identifying vulnerabilities. None of the other choices would identify vulnerabilities introduced by changes.

NEW QUESTION 217

Which of the following are the essential ingredients of a business impact analysis (BIA)?

- A. Downtime tolerance, resources and criticality
- B. Cost of business outages in a year as a factor of the security budget
- C. Business continuity testing methodology being deployed
- D. Structure of the crisis management team

Answer: A

Explanation:

The main purpose of a BIA is to measure the downtime tolerance, associated resources and criticality of a business function. Options B, C and D are all associated with business continuity planning, but are not related to the BIA.

NEW QUESTION 221

The MOST important reason for conducting periodic risk assessments is because:

- A. risk assessments are not always precis
- B. security risks are subject to frequent chang
- C. reviewers can optimize and reduce the cost of control
- D. it demonstrates to senior management that the security function can add valu

Answer: B

Explanation:

Risks are constantly changing. A previously conducted risk assessment may not include measured risks that have been introduced since the last assessment. Although an assessment can never be perfect and invariably contains some errors, this is not the most important reason for periodic reassessment. The fact that controls can be made more efficient to reduce costs is not sufficient. Finally, risk assessments should not be performed merely to justify the existence of the security function.

NEW QUESTION 225

Which of the following is the MOST usable deliverable of an information security risk analysis?

- A. Business impact analysis (BIA) report
- B. List of action items to mitigate risk
- C. Assignment of risks to process owners
- D. Quantification of organizational risk

Answer: B

Explanation:

Although all of these are important, the list of action items is used to reduce or transfer the current level of risk. The other options materially contribute to the way the actions are implemented.

NEW QUESTION 227

What mechanisms are used to identify deficiencies that would provide attackers with an opportunity to compromise a computer system?

- A. Business impact analyses
- B. Security gap analyses
- C. System performance metrics
- D. Incident response processes

Answer: B

Explanation:

A security gap analysis is a process which measures all security controls in place against typically good business practice, and identifies related weaknesses. A business impact analysis is less suited to identify security deficiencies. System performance metrics may indicate security weaknesses, but that is not their primary purpose. Incident response processes exist for cases where security weaknesses are exploited.

NEW QUESTION 229

To ensure that payroll systems continue on in an event of a hurricane hitting a data center, what would be the FIRST crucial step an information security manager would take in ensuring business continuity planning?

- A. Conducting a qualitative and quantitative risk analysis
- B. Assigning value to the asset
- C. Weighing the cost of implementing the plan v
- D. financial loss
- E. Conducting a business impact analysis (BIA).

Answer: D

Explanation:

BIA is an essential component of an organization's business continuity plan; it includes an exploratory component to reveal any vulnerabilities and a planning component to develop strategies for minimizing risk. It is the first crucial step in business continuity planning. Qualitative and quantitative risk analysis will have been completed to define the dangers to individuals, businesses and government agencies posed by potential natural and human-caused adverse events. Assigning value to assets is part of the BIA process. Weighing the cost of implementing the plan vs. financial loss is another part of the BIA.

NEW QUESTION 232

After a risk assessment, it is determined that the cost to mitigate the risk is much greater than the benefit to be derived. The information security manager should recommend to business management that the risk be:

- A. transferred
- B. treated
- C. accepted
- D. terminated

Answer: C

Explanation:

When the cost of control is more than the cost of the risk, the risk should be accepted. Transferring, treating or terminating the risk is of limited benefit if the cost of that control is more than the cost of the risk itself.

NEW QUESTION 235

A risk analysis should:

- A. include a benchmark of similar companies in its scope
- B. assume an equal degree of protection for all assets
- C. address the potential size and likelihood of loss
- D. give more weight to the likelihood v
- E. the size of the loss

Answer: C

Explanation:

A risk analysis should take into account the potential size and likelihood of a loss. It could include comparisons with a group of companies of similar size. It should not assume an equal degree of protection for all assets since assets may have different risk factors. The likelihood of the loss should not receive greater emphasis than the size of the loss; a risk analysis should always address both equally.

NEW QUESTION 238

Which of the following techniques MOST clearly indicates whether specific risk-reduction controls should be implemented?

- A. Countermeasure cost-benefit analysis
- B. Penetration testing
- C. Frequent risk assessment programs
- D. Annual loss expectancy (ALE) calculation

Answer: A

Explanation:

In a countermeasure cost-benefit analysis, the annual cost of safeguards is compared with the expected cost of loss. This can then be used to justify a specific control measure. Penetration testing may indicate the extent of a weakness but, by itself, will not establish the cost/benefit of a control. Frequent risk assessment programs will certainly establish what risk exists but will not determine the maximum cost of controls. Annual loss expectancy (ALE) is a measure which will contribute to the value of the risk but, alone, will not justify a control.

NEW QUESTION 239

An online banking institution is concerned that the breach of customer personal information will have a significant financial impact due to the need to notify and compensate customers whose personal information may have been compromised. The institution determines that residual risk will always be too high and decides to:

- A. mitigate the impact by purchasing insurance
- B. implement a circuit-level firewall to protect the network
- C. increase the resiliency of security measures in place
- D. implement a real-time intrusion detection system

Answer: A

Explanation:

Since residual risk will always be too high, the only practical solution is to mitigate the financial impact by purchasing insurance.

NEW QUESTION 244

Which of the following is the MOST effective way to treat a risk such as a natural disaster that has a low probability and a high impact level?

- A. Implement countermeasure
- B. Eliminate the risk
- C. Transfer the risk
- D. Accept the risk

Answer: C

Explanation:

Risks are typically transferred to insurance companies when the probability of an incident is low but the impact is high. Examples include: hurricanes, tornados and earthquakes. Implementing countermeasures may not be the most cost-effective approach to security management. Eliminating the risk may not be possible. Accepting the risk would leave the organization vulnerable to a catastrophic disaster which may cripple or ruin the organization. It would be more cost effective to pay recurring insurance costs than to be affected by a disaster from which the organization cannot financially recover.

NEW QUESTION 245

Which of the following attacks is BEST mitigated by utilizing strong passwords?

- A. Man-in-the-middle attack
- B. Brute force attack
- C. Remote buffer overflow
- D. Root kit

Answer: B

Explanation:

A brute force attack is normally successful against weak passwords, whereas strong passwords would not prevent any of the other attacks. Man-in-the-middle attacks intercept network traffic, which could contain passwords, but is not naturally password-protected. Remote buffer overflows rarely require a password to exploit a remote host. Root kits hook into the operating system's kernel and, therefore, operate underneath any authentication mechanism.

NEW QUESTION 246

Based on the information provided, which of the following situations presents the GREATEST information security risk for an organization with multiple, but small, domestic processing locations?

- A. Systems operation procedures are not enforced
- B. Change management procedures are poor
- C. Systems development is outsourced
- D. Systems capacity management is not performed

Answer: B

Explanation:

The lack of change management is a severe omission and will greatly increase information security risk. Since procedures are generally nonauthoritative, their lack of enforcement is not a primary concern. Systems that are developed by third-party vendors are becoming commonplace and do not represent an increase in security risk as much as poor change management. Poor capacity management may not necessarily represent a security risk.

NEW QUESTION 247

The PRIMARY objective of a risk management program is to:

- A. minimize inherent risk
- B. eliminate business risk
- C. implement effective control
- D. minimize residual risk

Answer: D

Explanation:

The goal of a risk management program is to ensure that residual risk remains within manageable levels. Management of risk does not always require the removal of inherent risk nor is this always possible. A possible benefit of good risk management is to reduce insurance premiums, but this is not its primary intention. Effective controls are naturally a clear objective of a risk management program, but with the choices given, choice C is an incomplete answer.

NEW QUESTION 249

For risk management purposes, the value of an asset should be based on:

- A. original cost
- B. net cash flow

- C. net present valu
- D. replacement cos

Answer: D

Explanation:

The value of a physical asset should be based on its replacement cost since this is the amount that would be needed to replace the asset if it were to become damaged or destroyed. Original cost may be significantly different than the current cost of replacing the asset. Net cash flow and net present value do not accurately reflect the true value of the asset.

NEW QUESTION 250

The PRIMARY reason for initiating a policy exception process is when:

- A. operations are too busy to compl
- B. the risk is justified by the benefi
- C. policy compliance would be difficult to enforc
- D. users may initially be inconvenience

Answer: B

Explanation:

Exceptions to policy are warranted in circumstances where compliance may be difficult or impossible and the risk of noncompliance is outweighed by the benefits. Being busy is not a justification for policy exceptions, nor is the fact that compliance cannot be enforced. User inconvenience is not a reason to automatically grant exception to a policy.

NEW QUESTION 255

Which of the following is the MAIN reason for performing risk assessment on a continuous basis'?

- A. Justification of the security budget must be continually mad
- B. New vulnerabilities are discovered every da
- C. The risk environment is constantly changin
- D. Management needs to be continually informed about emerging risk

Answer: C

Explanation:

The risk environment is impacted by factors such as changes in technology, and business strategy. These changes introduce new threats and vulnerabilities to the organization. As a result, risk assessment should be performed continuously. Justification of a budget should never be the main reason for performing a risk assessment. New vulnerabilities should be managed through a patch management process. Informing management about emerging risks is important, but is not the main driver for determining when a risk assessment should be performed.

NEW QUESTION 259

A risk management program should reduce risk to:

- A. zer
- B. an acceptable leve
- C. an acceptable percent of revenu
- D. an acceptable probability of occurrenc

Answer: B

Explanation:

Risk should be reduced to an acceptable level based on the risk preference of the organization. Reducing risk to zero is impractical and could be cost-prohibitive. Tying risk to a percentage of revenue is inadvisable since there is no direct correlation between the two. Reducing the probability of risk occurrence may not always be possible, as in the ease of natural disasters. The focus should be on reducing the impact to an acceptable level to the organization, not reducing the probability of the risk.

NEW QUESTION 260

The MOST effective way to incorporate risk management practices into existing production systems is through:

- A. policy developmen
- B. change managemen
- C. awareness trainin
- D. regular monitorin

Answer: B

Explanation:

Change is a process in which new risks can be introduced into business processes and systems. For this reason, risk management should be an integral component of the change management process. Policy development, awareness training and regular monitoring, although all worthwhile activities, are not as effective as change management.

NEW QUESTION 264

Because of its importance to the business, an organization wants to quickly implement a technical solution which deviates from the company's policies. An information security manager should:

- A. conduct a risk assessment and allow or disallow based on the outcome
- B. recommend a risk assessment and implementation only if the residual risks are acceptable
- C. recommend against implementation because it violates the company's policies
- D. recommend revision of current policies

Answer: B

Explanation:

Whenever the company's policies cannot be followed, a risk assessment should be conducted to clarify the risks. It is then up to management to accept the risks or to mitigate them. Management determines the level of risk they are willing to take. Recommending revision of current policy should not be triggered by a single request.

NEW QUESTION 266

Which of the following groups would be in the BEST position to perform a risk analysis for a business?

- A. External auditors
- B. A peer group within a similar business
- C. Process owners
- D. A specialized management consultant

Answer: C

Explanation:

Process owners have the most in-depth knowledge of risks and compensating controls within their environment. External parties do not have that level of detailed knowledge on the inner workings of the business. Management consultants are expected to have the necessary skills in risk analysis techniques but are still less effective than a group with intimate knowledge of the business.

NEW QUESTION 271

A mission-critical system has been identified as having an administrative system account with attributes that prevent locking and change of privileges and name. Which would be the BEST approach to prevent successful brute forcing of the account?

- A. Prevent the system from being accessed remotely
- B. Create a strong random password
- C. Ask for a vendor patch
- D. Track usage of the account by audit trails

Answer: B

Explanation:

Creating a strong random password reduces the risk of a successful brute force attack by exponentially increasing the time required. Preventing the system from being accessed remotely is not always an option in mission-critical systems and still leaves local access risks. Vendor patches are not always available, tracking usage is a detective control and will not prevent an attack.

NEW QUESTION 272

The purpose of a corrective control is to:

- A. reduce adverse event
- B. indicate compromise
- C. mitigate impact
- D. ensure compliance

Answer: C

Explanation:

Corrective controls serve to reduce or mitigate impacts, such as providing recovery capabilities. Preventive controls reduce adverse events, such as firewalls. Compromise can be detected by detective controls, such as intrusion detection systems (IDSs). Compliance could be ensured by preventive controls, such as access controls.

NEW QUESTION 273

After a risk assessment study, a bank with global operations decided to continue doing business in certain regions of the world where identity theft is rampant. The information security manager should encourage the business to:

- A. increase its customer awareness efforts in those regions
- B. implement monitoring techniques to detect and react to potential fraud
- C. outsource credit card processing to a third party
- D. make the customer liable for losses if they fail to follow the bank's advice

Answer: B

Explanation:

While customer awareness will help mitigate the risks, this is insufficient on its own to control fraud risk. Implementing monitoring techniques which will detect and deal with potential fraud cases is the most effective way to deal with this risk. If the bank outsources its processing, the bank still retains liability. While making the customer liable for losses is a possible approach, nevertheless, the bank needs to be seen to be proactive in managing its risks.

NEW QUESTION 277

A risk management approach to information protection is:

- A. managing risks to an acceptable level, commensurate with goals and objective
- B. accepting the security posture provided by commercial security product
- C. implementing a training program to educate individuals on information protection and risk
- D. managing risk tools to ensure that they assess all information protection vulnerabilities

Answer: A

Explanation:

Risk management is identifying all risks within an organization, establishing an acceptable level of risk and effectively managing risks which may include mitigation or transfer. Accepting the security posture provided by commercial security products is an approach that would be limited to technology components and may not address all business operations of the organization. Education is a part of the overall risk management process. Tools may be limited to technology and would not address non-technology risks.

NEW QUESTION 281

When implementing security controls, an information security manager must PRIMARILY focus on:

- A. minimizing operational impact
- B. eliminating all vulnerabilities
- C. usage by similar organization
- D. certification from a third party

Answer: A

Explanation:

Security controls must be compatible with business needs. It is not feasible to eliminate all vulnerabilities. Usage by similar organizations does not guarantee that controls are adequate. Certification by a third party is important, but not a primary concern.

NEW QUESTION 286

When a significant security breach occurs, what should be reported FIRST to senior management?

- A. A summary of the security logs that illustrates the sequence of events
- B. An explanation of the incident and corrective action taken
- C. An analysis of the impact of similar attacks at other organizations
- D. A business case for implementing stronger logical access controls

Answer: B

Explanation:

When reporting an incident to senior management, the initial information to be communicated should include an explanation of what happened and how the breach was resolved. A summary of security logs would be too technical to report to senior management. An analysis of the impact of similar attacks and a business case for improving controls would be desirable; however, these would be communicated later in the process.

NEW QUESTION 288

An information security organization should PRIMARILY:

- A. support the business objectives of the company by providing security-related support service
- B. be responsible for setting up and documenting the information security responsibilities of the information security team member
- C. ensure that the information security policies of the company are in line with global best practices and standard
- D. ensure that the information security expectations are conveyed to employee

Answer: A

Explanation:

The information security organization is responsible for options B and D within an organization, but they are not its primary mission. Reviewing and adopting appropriate standards (option C) is a requirement. The primary objective of an information security organization is to ensure that security supports the overall business objectives of the company.

NEW QUESTION 290

In a business impact analysis, the value of an information system should be based on the overall cost:

- A. of recover
- B. to recreat
- C. if unavailabl
- D. of emergency operation

Answer:

C

Explanation:

The value of an information system should be based on the cost incurred if the system were to become unavailable. The cost to design or recreate the system is not as relevant since a business impact analysis measures the impact that would occur if an information system were to become unavailable. Similarly, the cost of emergency operations is not as relevant.

NEW QUESTION 295

The PRIMARY goal of a corporate risk management program is to ensure that an organization's:

- A. IT assets in key business functions are protected
- B. business risks are addressed by preventive control
- C. stated objectives are achievable
- D. IT facilities and systems are always available

Answer: C

Explanation:

Risk management's primary goal is to ensure an organization maintains the ability to achieve its objectives. Protecting IT assets is one possible goal as well as ensuring infrastructure and systems availability. However, these should be put in the perspective of achieving an organization's objectives. Preventive controls are not always possible or necessary; risk management will address issues with an appropriate mix of preventive and corrective controls.

NEW QUESTION 299

When performing a risk assessment, the MOST important consideration is that:

- A. management supports risk mitigation effort
- B. annual loss expectations (ALEs) have been calculated for critical asset
- C. assets have been identified and appropriately valued
- D. attack motives, means and opportunities be understood

Answer: C

Explanation:

Identification and valuation of assets provides the basis for risk management efforts as it relates to the criticality and sensitivity of assets. Management support is always important, but is not relevant when determining the proportionality of risk management efforts. ALE calculations are only valid if assets have first been identified and appropriately valued. Motives, means and opportunities should already be factored in as a part of a risk assessment.

NEW QUESTION 301

Risk assessment should be built into which of the following systems development phases to ensure that risks are addressed in a development project?

- A. Programming
- B. Specification
- C. User testing
- D. Feasibility

Answer: D

Explanation:

Risk should be addressed as early as possible in the development cycle. The feasibility study should include risk assessment so that the cost of controls can be estimated before the project proceeds. Risk should also be considered in the specification phase where the controls are designed, but this would still be based on the assessment carried out in the feasibility study. Assessment would not be relevant in choice A or C.

NEW QUESTION 306

When residual risk is minimized:

- A. acceptable risk is probable
- B. transferred risk is acceptable
- C. control risk is reduced
- D. risk is transferable

Answer: A

Explanation:

Since residual risk is the risk that remains after putting into place an effective risk management program, it is probable that the organization will decide that it is an acceptable risk if sufficiently minimized. Transferred risk is risk that has been assumed by a third party, therefore its magnitude is not relevant. Accordingly, choices B and D are incorrect since transferred risk does not necessarily indicate whether risk is at an acceptable level. Minimizing residual risk will not reduce control risk.

NEW QUESTION 307

Which of the following risks would BEST be assessed using quantitative risk assessment techniques?

- A. Customer data stolen

- B. An electrical power outage
- C. A web site defaced by hackers
- D. Loss of the software development team

Answer: B

Explanation:

The effect of the theft of customer data or web site defacement by hackers could lead to a permanent decline in customer confidence, which does not lend itself to measurement by quantitative techniques. Loss of a majority of the software development team could have similar unpredictable repercussions. However, the loss of electrical power for a short duration is more easily measurable and can be quantified into monetary amounts that can be assessed with quantitative techniques.

NEW QUESTION 308

Quantitative risk analysis is MOST appropriate when assessment data:

- A. include customer perception
- B. contain percentage estimate
- C. do not contain specific detail
- D. contain subjective informatio

Answer: B

Explanation:

Percentage estimates are characteristic of quantitative risk analysis. Customer perceptions, lack of specific details or subjective information lend themselves more to qualitative risk analysis.

NEW QUESTION 313

Which of the following risks is represented in the risk appetite of an organization?

- A. Control
- B. Inherent
- C. Residual
- D. Audit

Answer: C

Explanation:

Residual risk is unmanaged, i.e., inherent risk which remains uncontrolled. This is key to the organization's risk appetite and is the amount of residual risk that a business is living with that affects its viability. Hence, inherent risk is incorrect. Control risk, the potential for controls to fail, and audit risk, which relates only to audit's approach to their work, are not relevant in this context.

NEW QUESTION 316

A successful information security management program should use which of the following to determine the amount of resources devoted to mitigating exposures?

- A. Risk analysis results
- B. Audit report findings
- C. Penetration test results
- D. Amount of IT budget available

Answer: A

Explanation:

Risk analysis results are the most useful and complete source of information for determining the amount of resources to devote to mitigating exposures. Audit report findings may not address all risks and do not address annual loss frequency. Penetration test results provide only a limited view of exposures, while the IT budget is not tied to the exposures faced by the organization.

NEW QUESTION 320

Which two components PRIMARILY must be assessed in an effective risk analysis?

- A. Visibility and duration
- B. Likelihood and impact
- C. Probability and frequency
- D. Financial impact and duration

Answer: B

Explanation:

The probability or likelihood of the event and the financial impact or magnitude of the event must be assessed first. Duration refers to the length of the event; it is important in order to assess impact but is secondary. Once the likelihood is determined, the frequency is also important to determine overall impact.

NEW QUESTION 324

Which of the following would be the FIRST step in establishing an information security program?

- A. Develop the security polic
- B. Develop security operating procedure
- C. Develop the security pla
- D. Conduct a security controls stud

Answer: C

Explanation:

A security plan must be developed to implement the security strategy. All of the other choices should follow the development of the security plan.

NEW QUESTION 326

Which of the following is the MOST effective solution for preventing internal users from modifying sensitive and classified information?

- A. Baseline security standards
- B. System access violation logs
- C. Role-based access controls
- D. Exit routines

Answer: C

Explanation:

Role-based access controls help ensure that users only have access to files and systems appropriate for their job role. Violation logs are detective and do not prevent unauthorized access. Baseline security standards do not prevent unauthorized access. Exit routines are dependent upon appropriate role-based access.

NEW QUESTION 329

Who can BEST advocate the development of and ensure the success of an information security program?

- A. Internal auditor
- B. Chief operating officer (COO)
- C. Steering committee
- D. IT management

Answer: C

Explanation:

Senior management represented in the security steering committee is in the best position to advocate the establishment of and continued support for an information security program. The chief operating officer (COO) will be a member of that committee. An internal auditor is a good advocate but is secondary to the influence of senior management. IT management has a lesser degree of influence and would also be part of the steering committee.

NEW QUESTION 331

For virtual private network (VPN) access to the corporate network, the information security manager is requiring strong authentication. Which of the following is the strongest method to ensure that logging onto the network is secure?

- A. Biometrics
- B. Symmetric encryption keys
- C. Secure Sockets Layer (SSL)-based authentication
- D. Two-factor authentication

Answer: D

Explanation:

Two-factor authentication requires more than one type of user authentication. While biometrics provides unique authentication, it is not strong by itself, unless a PIN or some other authentication factor is used with it. Biometric authentication by itself is also subject to replay attacks. A symmetric encryption method that uses the same secret key to encrypt and decrypt data is not a typical authentication mechanism for end users. This private key could still be compromised. SSL is the standard security technology for establishing an encrypted link between a web server and a browser. SSL is not an authentication mechanism. If SSL is used with a client certificate and a password, it would be a two-factor authentication.

NEW QUESTION 332

The BEST reason for an organization to have two discrete firewalls connected directly to the Internet and to the same DMZ would be to:

- A. provide in-depth defenses
- B. separate test and productio
- C. permit traffic load balancin
- D. prevent a denial-of-service attac

Answer: C

Explanation:

Having two entry points, each guarded by a separate firewall, is desirable to permit traffic load balancing. As they both connect to the Internet and to the same demilitarized zone (DMZ), such an arrangement is not practical for separating test from production or preventing a denial-of-service attack.

NEW QUESTION 333

Which of the following is MOST important for a successful information security program?

- A. Adequate training on emerging security technologies
- B. Open communication with key process owners
- C. Adequate policies, standards and procedures
- D. Executive management commitment

Answer: D

Explanation:

Sufficient executive management support is the most important factor for the success of an information security program. Open communication, adequate training, and good policies and procedures, while important, are not as important as support from top management; they will not ensure success if senior management support is not present.

NEW QUESTION 338

When configuring a biometric access control system that protects a high-security data center, the system's sensitivity level should be set:

- A. to a higher false reject rate (FRR).
- B. to a lower crossover error rate
- C. to a higher false acceptance rate (FAR).
- D. exactly to the crossover error rate

Answer: A

Explanation:

Biometric access control systems are not infallible. When tuning the solution, one has to adjust the sensitivity level to give preference either to false reject rate (type I error rate) where the system will be more prone to err denying access to a valid user or erring and allowing access to an invalid user. As the sensitivity of the biometric system is adjusted, these values change inversely. At one point, the two values intersect and are equal. This condition creates the crossover error rate, which is a measure of the system accuracy. In systems where the possibility of false rejects is a problem, it may be necessary to reduce sensitivity and thereby increase the number of false accepts. This is sometimes referred to as equal error rate (EER). In a very sensitive system, it may be desirable to minimize the number of false accepts—the number of unauthorized persons allowed access. To do this, the system is tuned to be more sensitive, which causes the false rejects the number of authorized persons disallowed access to increase.

NEW QUESTION 339

When a newly installed system for synchronizing passwords across multiple systems and platforms abnormally terminates without warning, which of the following should automatically occur FIRST?

- A. The firewall should block all inbound traffic during the outage
- B. All systems should block new logins until the problem is corrected
- C. Access control should fall back to no synchronized mode
- D. System logs should record all user activity for later analysis

Answer: C

Explanation:

The best mechanism is for the system to fallback to the original process of logging on individually to each system. Blocking traffic and new logins would be overly restrictive to the conduct of business, while recording all user activity would add little value.

NEW QUESTION 342

Primary direction on the impact of compliance with new regulatory requirements that may lead to major application system changes should be obtained from the:

- A. corporate internal auditor
- B. System developers/analyst
- C. key business process owner
- D. corporate legal counsel

Answer: C

Explanation:

Business process owners are in the best position to understand how new regulatory requirements may affect their systems. Legal counsel and infrastructure management, as well as internal auditors, would not be in as good a position to fully understand all ramifications.

NEW QUESTION 346

Which of the following guarantees that data in a file have not changed?

- A. Inspecting the modified date of the file
- B. Encrypting the file with symmetric encryption
- C. Using stringent access control to prevent unauthorized access
- D. Creating a hash of the file, then comparing the file hashes

Answer: D

Explanation:

A hashing algorithm can be used to mathematically ensure that data haven't been changed by hashing a file and comparing the hashes after a suspected change.

NEW QUESTION 347

What is the MOST important item to be included in an information security policy?

- A. The definition of roles and responsibilities
- B. The scope of the security program
- C. The key objectives of the security program
- D. Reference to procedures and standards of the security program

Answer: C

Explanation:

Stating the objectives of the security program is the most important element to ensure alignment with business goals. The other choices are part of the security policy, but they are not as important.

NEW QUESTION 348

Who can BEST approve plans to implement an information security governance framework?

- A. Internal auditor
- B. Information security management
- C. Steering committee
- D. Infrastructure management

Answer: C

Explanation:

Senior management that is part of the security steering committee is in the best position to approve plans to implement an information security governance framework. An internal auditor is secondary to the authority and influence of senior management. Information security management should not have the authority to approve the security governance framework. Infrastructure management will not be in the best position since it focuses more on the technologies than on the business.

NEW QUESTION 350

Which of the following is the BEST method to provide a new user with their initial password for e-mail system access?

- A. Interoffice a system-generated complex password with 30 days expiration
- B. Give a dummy password over the telephone set for immediate expiration
- C. Require no password but force the user to set their own in 10 days
- D. Set initial password equal to the user ID with expiration in 30 days

Answer: B

Explanation:

Documenting the password on paper is not the best method even if sent through interoffice mail if the password is complex and difficult to memorize, the user will likely keep the printed password and this creates a security concern. A dummy (temporary) password that will need to be changed upon first logon is the best method because it is reset immediately and replaced with the user's choice of password, which will make it easier for the user to remember. If it is given to the wrong person, the legitimate user will likely notify security if still unable to access the system, so the security risk is low. Setting an account with no initial password is a security concern even if it is just for a few days. Choice D provides the greatest security threat because user IDs are typically known by both users and security staff, thus compromising access for up to 30 days.

NEW QUESTION 352

A digital signature using a public key infrastructure (PKI) will:

- A. not ensure the integrity of a message
- B. rely on the extent to which the certificate authority (CA) is trusted
- C. require two parties to the message exchange
- D. provide a high level of confidentiality

Answer: B

Explanation:

The certificate authority (CA) is a trusted third party that attests to the identity of the signatory, and reliance will be a function of the level of trust afforded the CA. A digital signature would provide a level of assurance of message integrity, but it is a three-party exchange, including the CA. Digital signatures do not require encryption of the message in order to preserve confidentiality.

NEW QUESTION 353

The MAIN goal of an information security strategic plan is to:

- A. develop a risk assessment plan
- B. develop a data protection plan
- C. protect information assets and resources
- D. establish security governance

Answer: C

Explanation:

The main goal of an information security strategic plan is to protect information assets and resources. Developing a risk assessment plan and H data protection plan, and establishing security governance refer to tools utilized in the security strategic plan that achieve the protection of information assets and resources.

NEW QUESTION 354

The MAIN advantage of implementing automated password synchronization is that it:

- A. reduces overall administrative workloa
- B. increases security between multi-tier system
- C. allows passwords to be changed less frequentl
- D. reduces the need for two-factor authenticatio

Answer: A

Explanation:

Automated password synchronization reduces the overall administrative workload of resetting passwords. It does not increase security between multi-tier systems, allow passwords to be changed less frequently or reduce the need for two-factor authentication.

NEW QUESTION 359

The MOST effective way to ensure that outsourced service providers comply with the organization's information security policy would be:

- A. service level monitorin
- B. penetration testin
- C. periodically auditin
- D. security awareness trainin

Answer: C

Explanation:

Regular audit exercise can spot any gap in the information security compliance. Service level monitoring can only pinpoint operational issues in the organization's operational environment. Penetration testing can identify security vulnerability but cannot ensure information compliance Training can increase users' awareness on the information security policy, but is not more effective than auditing.

NEW QUESTION 363

At what stage of the applications development process would encryption key management initially be addressed?

- A. Requirements development
- B. Deployment
- C. Systems testing
- D. Code reviews

Answer: A

Explanation:

Encryption key management has to be integrated into the requirements of the application's design. During systems testing and deployment would be too late since the requirements have already been agreed upon. Code reviews are part of the final quality assurance (QA) process and would also be too late in the process.

NEW QUESTION 368

Which of the following is the MOST important item to consider when evaluating products to monitor security across the enterprise?

- A. Ease of installation
- B. Product documentation
- C. Available support
- D. System overhead

Answer: D

Explanation:

Monitoring products can impose a significant impact ON system overhead for servers and networks. Product documentation, telephone support and ease of installation, while all important, would be secondary.

NEW QUESTION 371

Which of the following devices should be placed within a demilitarized zone (DMZ)?

- A. Network switch
- B. Web server
- C. Database server
- D. File/print server

Answer: B

Explanation:

A web server should normally be placed within a demilitarized zone (DMZ) to shield the internal network. Database and file/print servers may contain confidential or valuable data and should always be placed on the internal network, never on a DMZ that is subject to compromise. Switches may bridge a DMZ to another network but do not technically reside within the DMZ network segment.

NEW QUESTION 372

An organization has adopted a practice of regular staff rotation to minimize the risk of fraud and encourage crosstraining. Which type of authorization policy would BEST address this practice?

- A. Multilevel
- B. Role-based
- C. Discretionary
- D. Attribute-based

Answer: B

Explanation:

A role-based policy will associate data access with the role performed by an individual, thus restricting access to data required to perform the individual's tasks. Multilevel policies are based on classifications and clearances. Discretionary policies leave access decisions up to information resource managers.

NEW QUESTION 376

Which of the following is the MOST effective solution for preventing individuals external to the organization from modifying sensitive information on a corporate database?

- A. Screened subnets
- B. Information classification policies and procedures
- C. Role-based access controls
- D. Intrusion detection system (IDS)

Answer: A

Explanation:

Screened subnets are demilitarized zones (DMZs) and are oriented toward preventing attacks on an internal network by external users. The policies and procedures to classify information will ultimately result in better protection but they will not prevent actual modification. Role-based access controls would help ensure that users only had access to files and systems appropriate for their job role. Intrusion detection systems (IDS) are useful to detect invalid attempts but they will not prevent attempts.

NEW QUESTION 377

Which of the following tools is MOST appropriate for determining how long a security project will take to implement?

- A. Gantt chart
- B. Waterfall chart
- C. Critical path
- D. Rapid Application Development (RAD)

Answer: C

Explanation:

The critical path method is most effective for determining how long a project will take. A waterfall chart is used to understand the flow of one process into another. A Gantt chart facilitates the proper estimation and allocation of resources. The Rapid Application Development (RAD) method is used as an aid to facilitate and expedite systems development.

NEW QUESTION 380

Which of the following is the MOST important reason why information security objectives should be defined?

- A. Tool for measuring effectiveness
- B. General understanding of goals
- C. Consistency with applicable standards
- D. Management sign-off and support initiatives

Answer: A

Explanation:

The creation of objectives can be used in part as a source of measurement of the effectiveness of information security management, which feeds into the overall governance. General understanding of goals and consistency with applicable standards are useful, but are not the primary reasons for having clearly defined objectives. Gaining management understanding is important, but by itself will not provide the structure for governance.

NEW QUESTION 381

An organization without any formal information security program that has decided to implement information security best practices should FIRST:

- A. invite an external consultant to create the security strateg
- B. allocate budget based on best practice

- C. benchmark similar organization
- D. define high-level business security requirement

Answer: D

Explanation:

All four options are valid steps in the process of implementing information security best practices; however, defining high-level business security requirements should precede the others because the implementation should be based on those security requirements.

NEW QUESTION 386

Which of the following is MOST effective in preventing weaknesses from being introduced into existing production systems?

- A. Patch management
- B. Change management
- C. Security baselines
- D. Virus detection

Answer: B

Explanation:

Change management controls the process of introducing changes to systems. This is often the point at which a weakness will be introduced. Patch management involves the correction of software weaknesses and would necessarily follow change management procedures. Security baselines provide minimum recommended settings and do not prevent introduction of control weaknesses. Virus detection is an effective tool but primarily focuses on malicious code from external sources, and only for those applications that are online.

NEW QUESTION 388

The effectiveness of virus detection software is MOST dependent on which of the following?

- A. Packet filtering
- B. Intrusion detection
- C. Software upgrades
- D. Definition tables

Answer: D

Explanation:

The effectiveness of virus detection software depends on virus signatures which are stored in virus definition tables. Software upgrades are related to the periodic updating of the program code, which would not be as critical. Intrusion detection and packet filtering do not focus on virus detection.

NEW QUESTION 392

Which of the following ensures that newly identified security weaknesses in an operating system are mitigated in a timely fashion?

- A. Patch management
- B. Change management
- C. Security baselines
- D. Acquisition management

Answer: A

Explanation:

Patch management involves the correction of software weaknesses and helps ensure that newly identified exploits are mitigated in a timely fashion. Change management controls the process of introducing changes to systems. Security baselines provide minimum recommended settings. Acquisition management controls the purchasing process.

NEW QUESTION 396

Which of the following is the MOST important consideration when securing customer credit card data acquired by a point-of-sale (POS) cash register?

- A. Authentication
- B. Hardening
- C. Encryption
- D. Nonrepudiation

Answer: C

Explanation:

Cardholder data should be encrypted using strong encryption techniques. Hardening would be secondary in importance, while nonrepudiation would not be as relevant. Authentication of the point-of-sale (POS) terminal is a previous step to acquiring the card information.

NEW QUESTION 398

Which of the following is the MOST effective type of access control?

- A. Centralized

- B. Role-based
- C. Decentralized
- D. Discretionary

Answer: B

Explanation:

Role-based access control allows users to be grouped into job-related categories, which significantly cases the required administrative overhead. Discretionary access control would require a greater degree of administrative overhead. Decentralized access control generally requires a greater number of staff to administer, while centralized access control is an incomplete answer.

NEW QUESTION 399

Which of the following would be the BEST defense against sniffing?

- A. Password protect the files
- B. Implement a dynamic IP address scheme
- C. Encrypt the data being transmitted
- D. Set static mandatory access control (MAC) addresses

Answer: C

Explanation:

Encrypting the data will obfuscate the data so that they are not visible in plain text. Someone would have to collate the entire data stream and try decrypting it, which is not easy. Passwords can be recovered by brute-force attacks and by password crackers, so this is not the best defense against sniffing. IP addresses can always be discovered, even if dynamic IP addresses are implemented. The person sniffing traffic can initiate multiple sessions for possible IP addresses. Setting static mandatory access control (MAC) addresses can prevent address resolution protocol (ARP) poisoning, but it does not prevent sniffing.

NEW QUESTION 403

On which of the following should a firewall be placed?

- A. Web server
- B. Intrusion detection system (IDS) server
- C. Screened subnet
- D. Domain boundary

Answer: D

Explanation:

A firewall should be placed on a (security) domain boundary. Placing it on a web server or screened subnet, which is a demilitarized zone (DMZ), does not provide any protection. Since firewalls should be installed on hardened servers with minimal services enabled, it is inappropriate to have the firewall and the intrusion detection system (IDS) on the same physical device.

NEW QUESTION 406

In an organization, information systems security is the responsibility of:

- A. all personne
- B. information systems personne
- C. information systems security personne
- D. functional personne

Answer: A

Explanation:

All personnel of the organization have the responsibility of ensuring information systems security-this can include indirect personnel such as physical security personnel. Information systems security cannot be the responsibility of information systems personnel alone since they cannot ensure security. Information systems security cannot be the responsibility of information systems security personnel alone since they cannot ensure security. Information systems security cannot be the responsibility of functional personnel alone since they cannot ensure security.

NEW QUESTION 410

What is an appropriate frequency for updating operating system (OS) patches on production servers?

- A. During scheduled rollouts of new applications
- B. According to a fixed security patch management schedule
- C. Concurrently with quarterly hardware maintenance
- D. Whenever important security patches are released

Answer: D

Explanation:

Patches should be applied whenever important security updates are released. They should not be delayed to coincide with other scheduled rollouts or maintenance. Due to the possibility of creating a system outage, they should not be deployed during critical periods of application activity such as month-end or quarter-end closing.

NEW QUESTION 414

The information classification scheme should:

- A. consider possible impact of a security breach
- B. classify personal information in electronic form
- C. be performed by the information security manager
- D. classify systems according to the data processes

Answer: A

Explanation:

Data classification is determined by the business risk, i.e., the potential impact on the business of the loss, corruption or disclosure of information. It must be applied to information in all forms, both electronic and physical (paper), and should be applied by the data owner, not the security manager. Choice B is an incomplete answer because it addresses only privacy issues, while choice A is a more complete response. Systems are not classified per se, but the data they process and store should definitely be classified.

NEW QUESTION 415

The MAIN reason for deploying a public key infrastructure (PKI) when implementing an information security program is to:

- A. ensure the confidentiality of sensitive materials
- B. provide a high assurance of identity
- C. allow deployment of the active directory
- D. implement secure sockets layer (SSL) encryption

Answer: B

Explanation:

The primary purpose of a public key infrastructure (PKI) is to provide strong authentication. Confidentiality is a function of the session keys distributed by the PKI. An active directory can use PKI for authentication as well as using other means. Even though secure sockets layer (SSL) encryption requires keys to authenticate, it is not the main reason for deploying PKI.

NEW QUESTION 420

Which of the following practices is BEST to remove system access for contractors and other temporary users when it is no longer required?

- A. Log all account usage and send it to their manager
- B. Establish predetermined automatic expiration dates
- C. Require managers to e-mail security when the user leaves
- D. Ensure each individual has signed a security acknowledgement

Answer: B

Explanation:

Predetermined expiration dates are the most effective means of removing systems access for temporary users. Reliance on managers to promptly send in termination notices cannot always be counted on, while requiring each individual to sign a security acknowledgement would have little effect in this case.

NEW QUESTION 422

Security awareness training is MOST likely to lead to which of the following?

- A. Decrease in intrusion incidents
- B. Increase in reported incidents
- C. Decrease in security policy changes
- D. Increase in access rule violations

Answer: B

Explanation:

Reported incidents will provide an indicator as to the awareness level of staff. An increase in reported incidents could indicate that staff is paying more attention to security. Intrusion incidents and access rule violations may or may not have anything to do with awareness levels. A decrease in changes to security policies may or may not correlate to security awareness training.

NEW QUESTION 426

Which of the following is the BEST method to securely transfer a message?

- A. Password-protected removable media
- B. Facsimile transmission in a secured room
- C. Using public key infrastructure (PKI) encryption
- D. Steganography

Answer: C

Explanation:

Using public key infrastructure (PKI) is currently accepted as the most secure method to transmit e-mail messages. PKI assures confidentiality, integrity and nonrepudiation. The other choices are not methods that are as secure as PKI. Steganography involves hiding a message in an image.

NEW QUESTION 430

Which of the following BEST provides message integrity, sender identity authentication and nonrepudiation?

- A. Symmetric cryptography
- B. Public key infrastructure (PKI)
- C. Message hashing
- D. Message authentication code

Answer: B

Explanation:

Public key infrastructure (PKI) combines public key encryption with a trusted third party to publish and revoke digital certificates that contain the public key of the sender. Senders can digitally sign a message with their private key and attach their digital certificate (provided by the trusted third party). These characteristics allow senders to provide authentication, integrity validation and nonrepudiation. Symmetric cryptography provides confidentiality. Mashing can provide integrity and confidentiality. Message authentication codes provide integrity.
